### Experiment No: 05

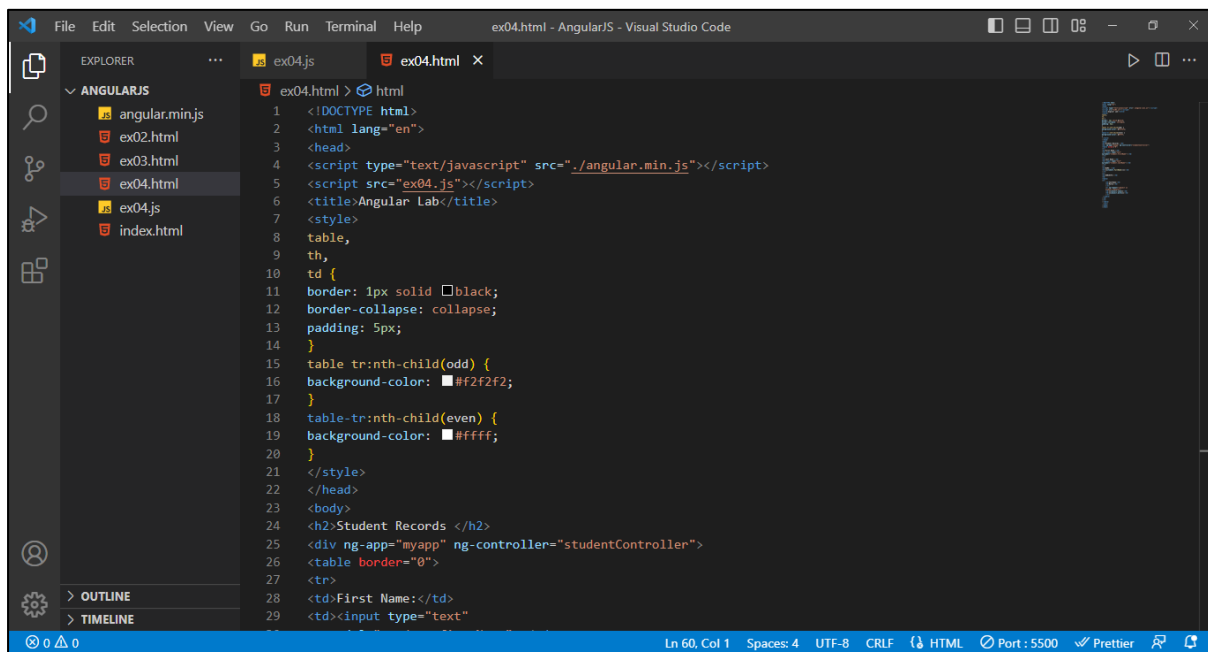

**Title:** Create an application for like student records using AngularJS.

#### Theory:

- **NG-CONTROLLER:** The ng-controller directive adds a controller to your application. In the controller, you can write code, and make functions and variables, which will be parts of an object, available inside the current HTML element. In AngularJS this object is called a scope.
- **NG-MODEL:** Ng-model is a directive in Angular. JS represents models and its primary purpose is to bind the “view” to the “model”. The ng-model directive binds the value of HTML controls (input, select, text area) to application data.
- **NG-APP:** The ng-app directive is a starting point for the AngularJS Application. It initializes the AngularJS framework automatically. AngularJS framework will first check for the ng-app directive in an HTML document after the entire document is loaded and if ng-app is found, it bootstraps itself and compiles the HTML template.

#### Input:

exp.html (file)

```
1 <!DOCTYPE html>
2 <html lang="en">
3 <head>
4 <script type="text/javascript" src="angular.min.js"></script>
5 <script src="ex04.js"></script>
6 <title>Angular Lab</title>
7 <style>
8 table,
9 th,
10 td {
11 border: 1px solid black;
12 border-collapse: collapse;
13 padding: 5px;
14 }
15 table tr:nth-child(odd) {
16 background-color: #f2f2f2;
17 }
18 table tr:nth-child(even) {
19 background-color: #ffffff;
20 }
21 </style>
22 </head>
23 <body>
24 <h2>Student Records </h2>
25 <div ng-app="myapp" ng-controller="studentController">
26 <table border="0">
27 <tr>
28 <td>First Name:</td>
29 <td><input type="text">
```

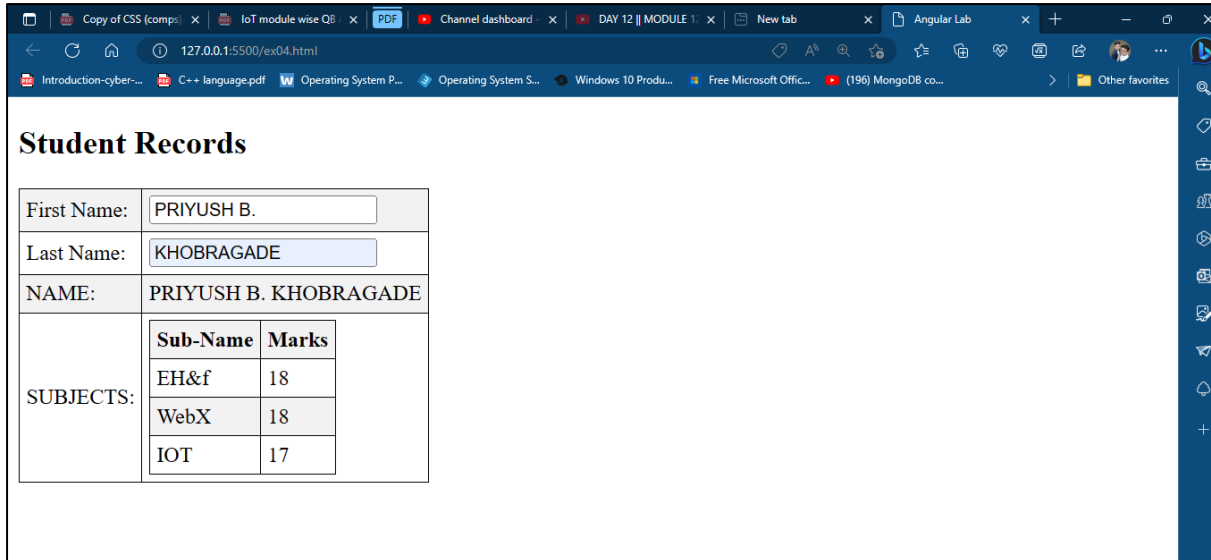

## Jawahar Education Society's Annasaheb Chudaman Patil College of Engineering, Kharghar, Navi Mumbai

```
27 </tr>
28 <td>First Name:</td>
29 <td><input type="text"
30 ng-model="student.firstName"></td>
31 </tr>
32 <tr>
33 <td>Last Name:</td>
34 <td><input type="text"
35 ng-model="student.lastName"></td>
36 </tr>
37 <tr>
38 <td>NAME: </td>
39 <td>{{student.fullName()}}</td>
40 </tr>
41 <tr>
42 <td>SUBJECTS:</td>
43 <td>
44 <table>
45 <tr>
46 <th>Sub-Name</th>
47 <th>Marks</th>
48 </tr>
49 <tr ng-repeat="subject in
50 student.subjects">
51 <td>{{subject.name}}</td>
52 <td>{{subject.marks}}</td>
53 </tr>
54 </table>
55 </td>
56 </tr>
57 </table>
58 </div>
59 </body>
60 </html>
```

exp.js (file)

```
1 var myapp = angular.module("myapp", []);
2 myapp.controller('studentController', function($scope){
3   $scope.student={
4     firstName:"Hardik",
5     lastName:"Dadas",
6     rollNo:52,
7     subjects:[
8       {name:'EH&f', marks:17},
9       {name:'WebX', marks: 20},
10      {name:'IOT', marks: 15}
11    ],
12    fullName:function(){
13      var studentObject = $scope.student;
14      return studentObject.firstName+ " "+studentObject.lastName;
15    }
16  }
17  $scope.student={
18    firstName:"Hardik",
19    lastName:"Dadas",
20    rollNo:52,
21    subjects:[
22      {name:'EH&f', marks:18},
23      {name:'WebX', marks: 18},
24      {name:'IOT', marks: 17}
25    ],
26    fullName:function(){
27      var studentObject = $scope.student;
28      return studentObject.firstName+ " "+studentObject.lastName;
29    }
30  }}
31
32
```

## Output:

First Name:	<input type="text" value="PRIYUSH B."/>								
Last Name:	<input type="text" value="KHOBRADE"/>								
NAME:	PRIYUSH B. KHOBRADE								
SUBJECTS:	<table border="1"><thead><tr><th>Sub-Name</th><th>Marks</th></tr></thead><tbody><tr><td>EH&amp;f</td><td>18</td></tr><tr><td>WebX</td><td>18</td></tr><tr><td>IOT</td><td>17</td></tr></tbody></table>	Sub-Name	Marks	EH&f	18	WebX	18	IOT	17
	Sub-Name	Marks							
	EH&f	18							
	WebX	18							
IOT	17								

**Conclusion:** - Thus we have created an application for student records using AngularJs.
